

What is Citymes?

Short summary draft of what Citymes App needs to become

Citymes is a webapp that uses the Telegram Bot API written in PHP with a web interface using HTML5 + CSS3 and JavaScript.

The Citymes webapp will be a website where you can create an account and with your account you can manage your own Telegram Bots and Telegram Channels through a friendly web interface without the need of coding.

Citymes will have different account levels that will be paid.

For example:

Level 1 account will cost 30€/month and will only be able to manage one Telegram Bot with the ability to create and configure 10 custom commands.

Level 2 account will cost 50€/month and will be able to manage one Telegram Bot with 20 commands and one Telegram Channel.

Once registered with your account, you will have a web panel where you can create/vinculate your first Bot. It will show you a friendly manual of how you have to create the Telegram Bot using the BotFather and how you have to vinculate to Citymes.

Once the Telegram Bot is vinculated, you will be able to create commands, auto responses and more for your bot trough forms, buttons and other friendly ways to help the user configure his bot.

The user will be able also to vinculate a Channel the same way than the bot, and using the webapp he will be able to send messages through the Citymes webapp to the Channel without having to use any of the Telegram own apps.

Some tech details:

PHP-Laravel

PHP Telegram Bot (<https://github.com/akalongman/php-telegram-bot>)

MySQL

HTML5

CSS3

Bootstrap

Javascript/JQuery/ Ajax

Botan.io for statistics

GIT with bitbucket private repository
